Location

Lake Worth Christian School is a PreK–12 college preparatory Christian school located in Lake Worth, Florida, with a mission of growing Christian leaders through an education rooted in faith, academic excellence, and servant leadership. Founded in 1959, the school has graduated over 1,400 students and operates across multiple buildings serving preschool through high school programs, including a separate Beginnings Campus for early childhood education. The campus features classrooms, a gymnasium, athletic facilities, and dedicated spaces for fine arts, STEM, and spiritual life — all designed to nurture the whole student in a vibrant, Christ-centered community.

With students, staff, and families active across multiple buildings throughout the day, maintaining a safe, secure, and well-connected campus environment is essential to fulfilling the school's mission and the trust that families place in Lake Worth Christian every single day.

Challenge

As Lake Worth Christian School continued to grow and expand across multiple buildings, the time had come to bring its security and communication infrastructure in line with the demands of a modern, multi-building campus. Like many growing schools, access control had evolved organically over time — and with that growth came the need for a more unified, credential-based approach to managing entry points consistently across all buildings, ensuring that every door, every lobby, and every common area was covered under one cohesive system.

Hand in hand with that need came a gap in campus-wide communication. The existing PA and bell schedule system was analog and operated independently across buildings — making it difficult to communicate quickly and uniformly in day-to-day operations, let alone in an emergency. As the school looked toward the future, the vision became clear: a single, integrated platform that could control who enters the campus and instantly reach every student and staff member across every building simultaneously when it mattered most. With the safety of children at the center of every decision, Lake Worth Christian set out to build a security and communication infrastructure worthy of the community it serves.

“AT&I’s partnership has significantly enhanced the safety of our campus — from our audio system to access control, their work has made a meaningful impact on our community. Their customer service is truly exceptional, the best I’ve experienced, and they will always be my first call.”

– Dustin Bowlin, Superintendent, Lake Worth Christian School

Solution

AT&I Systems designed and implemented a comprehensive security and communications upgrade at Lake Worth Christian School, bringing access control and emergency mass notification together under one cohesive, campus-wide platform.

On the access control side, AT&I expanded the school's existing Avigilon ALTA cloud platform across all campus buildings — installing new panels, video intercom readers, smart card readers, and maglocks at key entry points throughout. Every controlled door across the campus is now unified under a single, centrally managed system, giving administrators complete visibility and control over who can access any area of the campus at any time.

For campus-wide communications, AT&I installed a Singlewire InformaCast Fusion PA system, transitioning the school to a fully digital, IP-based platform that connects every building and outdoor space under one unified voice. Existing speaker infrastructure was integrated onto the new platform and new speakers were added where needed to ensure complete coverage across the entire campus. The InformaCast system now manages the school's bell schedule digitally and enables one-touch mass notifications for lockdowns, weather alerts, and any other emergency — instantly reaching every corner of campus simultaneously with the press of a button.

Results

The upgrades gave Lake Worth Christian School a modern, unified security and communications infrastructure that strengthens both the daily management of the campus and the school's ability to respond when it matters most. Consistent access control across all buildings gives staff, parents, and administrators greater confidence in the safety of the campus environment, while the video intercom at the main entrance brings a seamless, professional touch to the visitor experience.

The Singlewire InformaCast system gave the school something every campus should have — the ability to reach every student and staff member instantly, from one place, with one action. Whether it's the morning bell or a campus-wide emergency, the entire community is connected and informed in real time. For a school whose mission is to grow the next generation of Christian leaders, having a campus that is as safe, connected, and prepared as it is academically excellent is a reflection of everything Lake Worth Christian stands for.
